

Cleanrooms and laboratories

Clean room using half round duct attached directly to the ceiling.

FabricAir Distribution are well-suited in clean rooms especially with fume hoods and for laboratories or rooms with varying demands, VAV systems.

FabricAir Distribution in Clean rooms is ranging from Class 10.000 to 100000 and under the american (209 D and E) and europeans norms.

Large amounts of air can be supplied to a room at very low velocities for both heating and cooling.

A range of different air flow technologies are available ranging from low velocity FabFlow to mid level velocities as PerfoFlow, SonicFlow or MeshFlow or higher.

The dispersion system can be attached directly to the ceiling forming a d-shape duct, or hanging as round. Other shapes are available too.

FabricAir fabrics are well-suited in most clean room facilities of class ISO 7 or lower, class 10.000, due to a minimum of separation of fibres into the room.

Benefits

- Well-suited in clean rooms ranging from class 10.000 to 100.000
- Large air volume at low velocity and without draft
- Minimum of fibre separations from fabric into the room
- Even air distribution
- ISO9001 quality management system
- Oeko-Tex certified fabrics which are environmental friendly
- Sound level NC20 or below which practically is noise free
- Microbe free
- Washable and hygienic
- Flame retardant
- Many colors
